Company: Oddbox

Part 1: Introduction and Theory Selection:

Nearly 40% of UK grown fruits and vegetables don't reach consumers because they are deemed the wrong size, shape or surplus. Oddbox was created to tackle this issue through a mission led rescue model that delivers imperfect or surplus fruits and vegetables to UK homes. Its unique selling point lies in combining convenience and tackling food waste at a farm level, reducing carbon emission and saving water, which appeals to eco-conscious consumers.

Oddbox targets urban, eco-conscious consumers who value sustainability, food waste reduction and healthy eating. Its audience includes young professionals and eco-minded families with affluent incomes (Jefferson, 2022). They are tech-savvy, socially engaged, active online, and motivated by a strong “feel good” factor from doing good.

This report analyzes Oddbox through their Website and Search marketing. A website is seen as a brand’s “Digital Home”, where clear design, logical structure, intuitive navigation and fast performance support trust, engagement and conversions. It covers Site Design, Navigation and Navigation Systems, Page Design, Content Design and Website flow and Loading Performance.

Search marketing focuses on improving visibility through SEO and PPC. SEO supports long-term, credible growth through content, technical optimisation and backlinks, while PPC delivers short-term visibility and measurable results. This report focuses mainly on SEO, with limited PPC coverage.

Website marketing is strong for building trust, explaining a subscription model and driving conversions, but it relies heavily on good UX and does little to create initial awareness. SEO attracts high-intent, credible traffic at low long-term cost, though results are slow and algorithm dependent. PPC delivers fast, targeted visibility and clear measurement, but is expensive, competitive and stops working once spend ends.

Part 2: Analysis

Website Marketing:

Site Design:

Oddbox's website presents a modern, user-friendly design that reflects its brand personality and values through a friendly, vibrant style using earthy colours and wonky vegetable imagery, positioning it as a fun solution to food waste while addressing sustainability with playful language (Figure1).

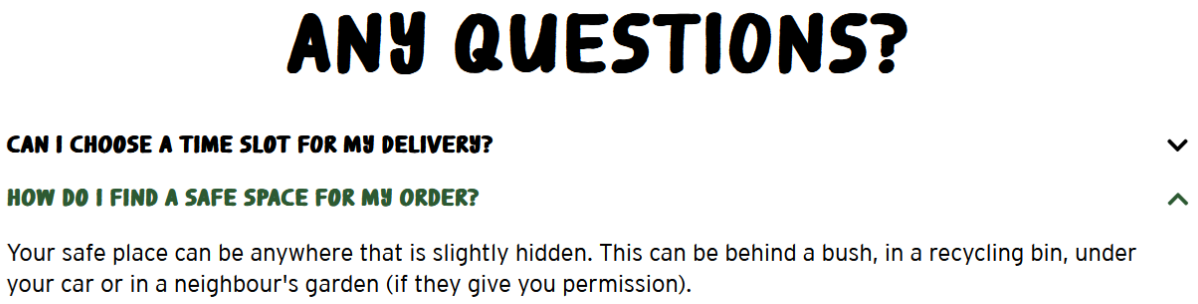

Figure1: Playful tone in FAQ's.

Graphic design elements remain clean, fun and professional, communicating "doing good" and building trust in sustainability focused markets, with the visual identity aligning with UN SDG 12 by emphasising waste reduction. However, while the homescreen is characterful, it places greater emphasis on brand than product, meaning some users may not fully understand the service from the tagline alone, which is not ideal as the homepage should act as a clear elevator pitch for the brand (Wang, 2024).

Navigation and Navigation Systems:

Oddbox's website offers easy navigation through a clear top bar, using a broad and shallow structure that supports usability (Rose, 2013). Persistent navigation, visible CTAs, active states and breadcrumbs help users understand where they are, while page reachability within a few clicks aligns with the 3 Click Rule (Tiller, 2025). The inclusion of a Trustpilot link also supports social proofing; however, the absence of a search bar limits users' ability to make specific queries.

Page Design:

Oddbox's page design is clean, consistent and user-centric, using balanced layouts, typography and a clear visual hierarchy (Figure2),

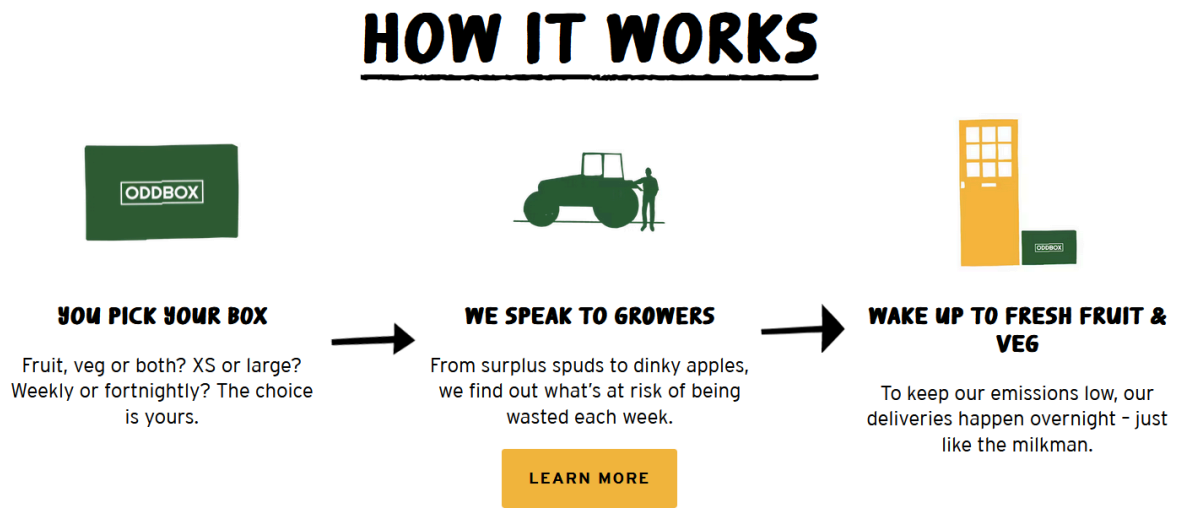

Figure2: Use of illustration for visual understanding.

This follows content hierarchy best practices by presenting key information upfront and supporting details further down the page (Wang, 2024). The responsive design supports accessibility through scalable text, while Trustpilot reviews and B Corp certification act as strong trust indicators; however, some content-heavy pages require extensive scrolling, which may cause fatigue (Interaction Design Foundation, 2023), and pricing lacks immediate clarity (Figure3).

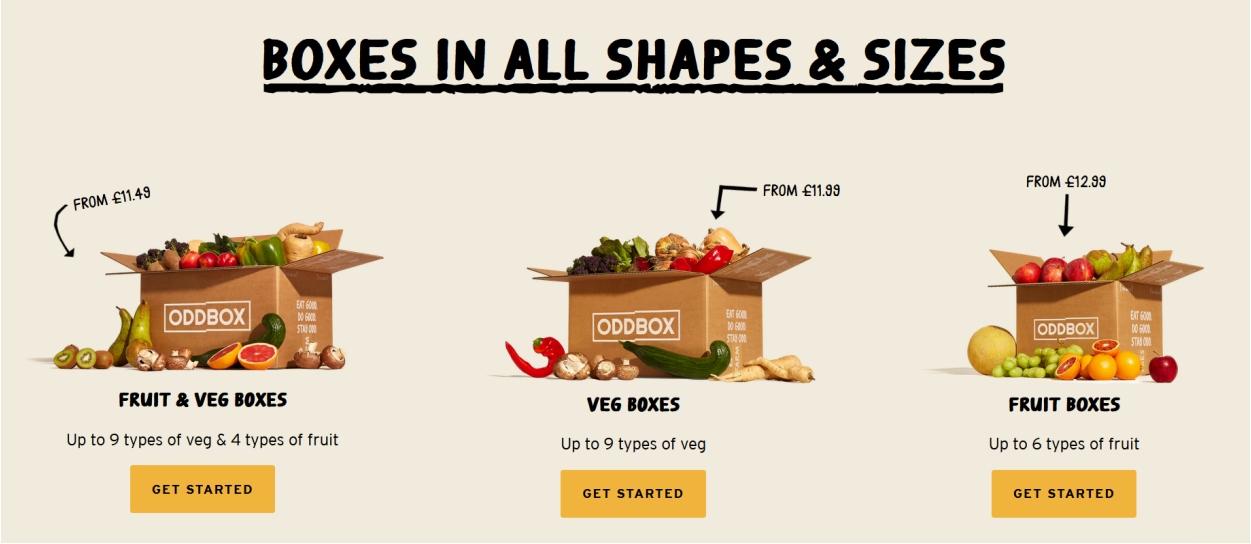

Figure3: Pricing illegible.

Content Design:

Oddbox's purpose-driven content clearly communicates its offerings and engagement options

through a well-structured content hierarchy, with social consciousness reflected in its tagline and copy such as “Eat Good, Do Good, Stay Good” (Figure4).

Figure4: Showcasing Oddbox.

Mission led storytelling and education are embedded within the “Our Mission” section (Figure5), while recipes and blogs add value by reinforcing waste reduction.

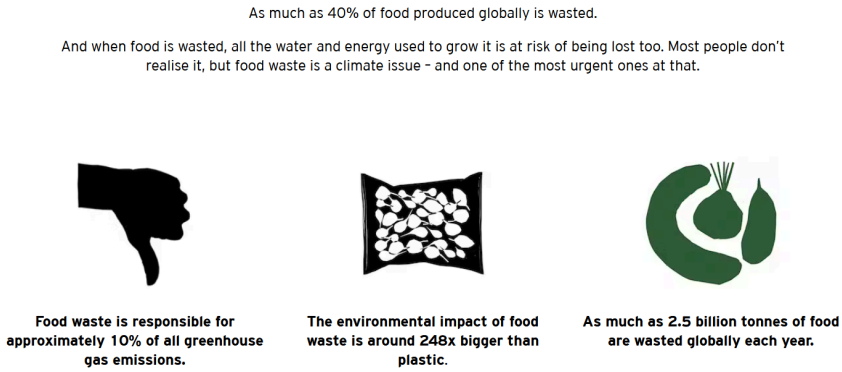

Figure5: About Us Page with statistical education.

However, strong brand emphasis can overshadow customer value and clearer consumer benefit led messaging alongside live support could improve understanding.

Website Flow and Loading Performance:

Oddbox guides users to subscription with a curious tagline: “Fight food waste with a delivery of delicious odd fruit and veg.” Clear CTA aligns with usability best practices (Orbit Media, 2016). This progression guides users well to understand the product and engage with them, so the overall funnel is positive. LCP of 1.2 on Pagespeed Insight proves great loading speeds(Figure6)

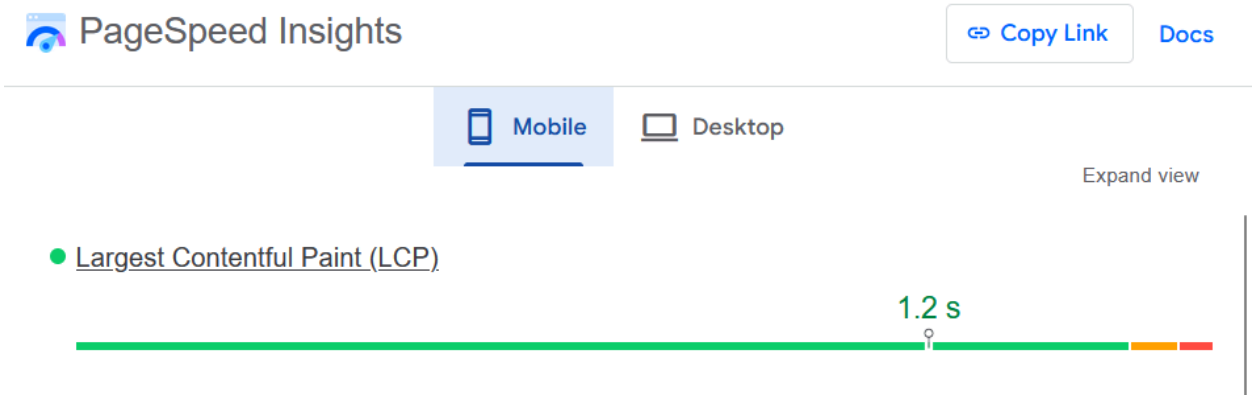

Figure6: PageSpeed Insights snippet.

Search Marketing:

SEO Performance:

Oddbox operates in the food delivery and sustainability focused e-commerce sector, with their website generating substantial around 100k traffic monthly. The company maintains a bounce rate of 34.97%, 3.85 pages per visit and an average time of 2:07 minutes which indicate moderate to high levels of engagement. With organic search only accounting for 27.5% of overall traffic, there is significant room for improvement with respect to SEO.

Refer Appendix 1 for more information and all sources related to statistical data.

On Page SEO:

Oddbox’s on-page SEO shows several strengths alongside clear areas for improvement. The site uses clean, descriptive URLs with relevant keywords, aligning with best practices. However, page titles and meta descriptions are inconsistent; strong on core pages but weaker on blogs due to generic messaging, while headings follow a clear hierarchy that supports accessibility and SEO. Content is user-focused and natural, aligning with Google’s latest updates and avoiding keyword stuffing. Recipe and “how-to” blogs typically range between 1,200–1,800 words, supporting topical authority, but overlapping ingredient guides increase the risk of keyword cannibalisation without clear pillar content and internal linking. The AIDA framework is applied effectively through attention grabbing headlines, benefit led subheadings, and clear CTAs across the website.

From a keyword perspective, Oddbox performs well for branded searches and high-volume informational queries around fruits and vegetables, but visibility for high-intent, commercial terms such as “fruit box” remains limited, creating a gap in non-branded demand capture. There is also some keyword cannibalisation risk from similar “how to cook” guides, though no evidence of doorway pages, and Gatsby Architecture’s (Figure7) use of canonical tags helps prevent duplicate content. Multimedia use is strong through imagery and illustrations, but video adoption is limited, 23 images lack alt tags, and some large image files may slow page load speeds. Finally, Oddbox has around 40 internal links connecting core pages and blogs, though cross-linking between thematic content clusters remains underdeveloped.

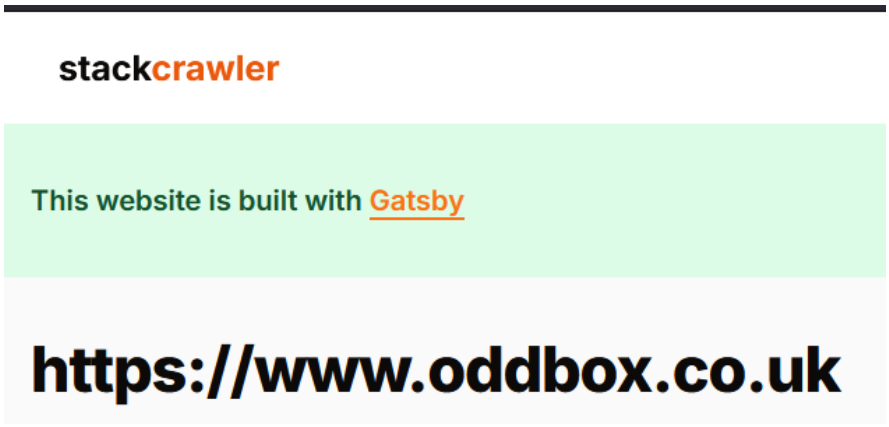

Figure7: Verification of Gatsby Architecture.

Off Page SEO:

Backlinks and Authority: Oddbox has around 43K external backlinks from roughly 2.2K referring domains and a Domain Authority of 45, indicating a reasonably strong backlink profile for a consumer food brand. Oddbox has a high number of exact and partial match anchor texts, which could seem unnatural and lead to penalties.

Technical SEO:

Oddbox’s Gatsby architecture supports crawlability through submitted sitemaps and clear site hierarchy. While the framework generally produces clean code, some scripts and third-party integrations may affect performance. The site is mobile-first compliant, serving consistent HTML across devices, and uses schema markup, improving search engine understanding and eligibility for rich results (Figure8).

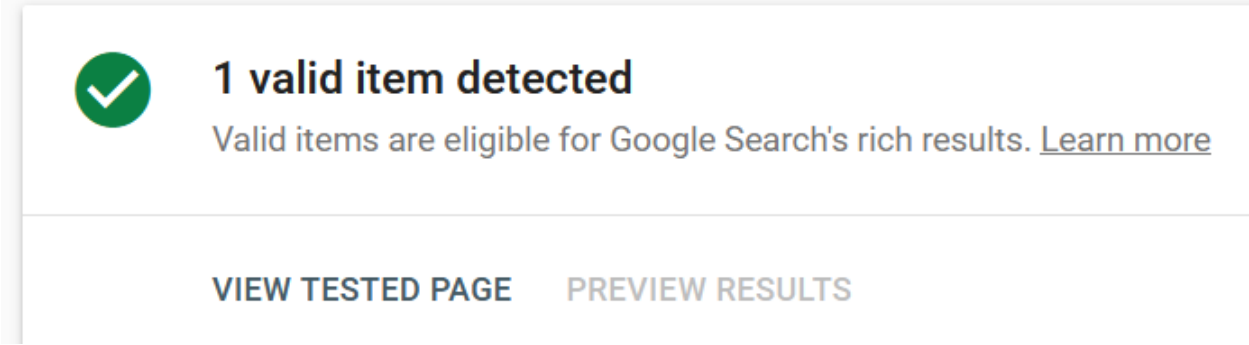

Figure8: Google's Rich Result Test snippet.

PPC:

Oddbox mainly uses Google Ads to target high-intent searches around fruit and veg boxes and food delivery (Figure9).

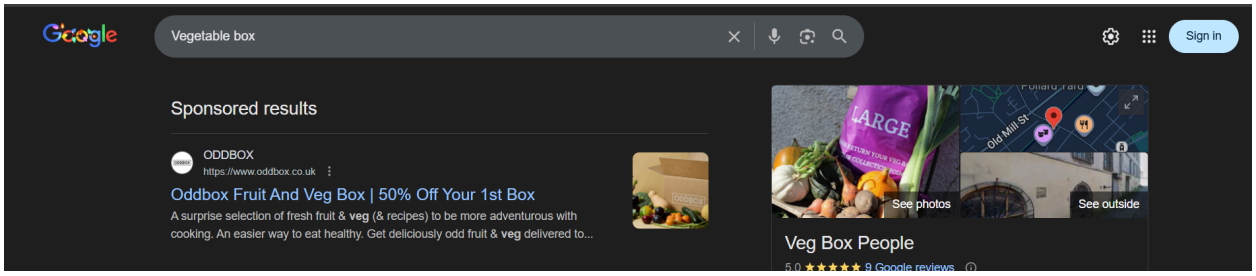

Figure9: Sponsored Clip.

Paid social supports this by promoting offers and sustainability led storytelling to targeted audiences (Bark, 2025). Overall, PPC focuses on capturing existing demand and retargeting interested users rather than driving primary awareness.
To summarise, the website helps with MOFU, SEO helps with TOFU and PPC helps BOFU in the case of Oddbox.

Part 3: Recommendation and Implementation:

Visual Summary:

Below is a visual summary of the analysis:

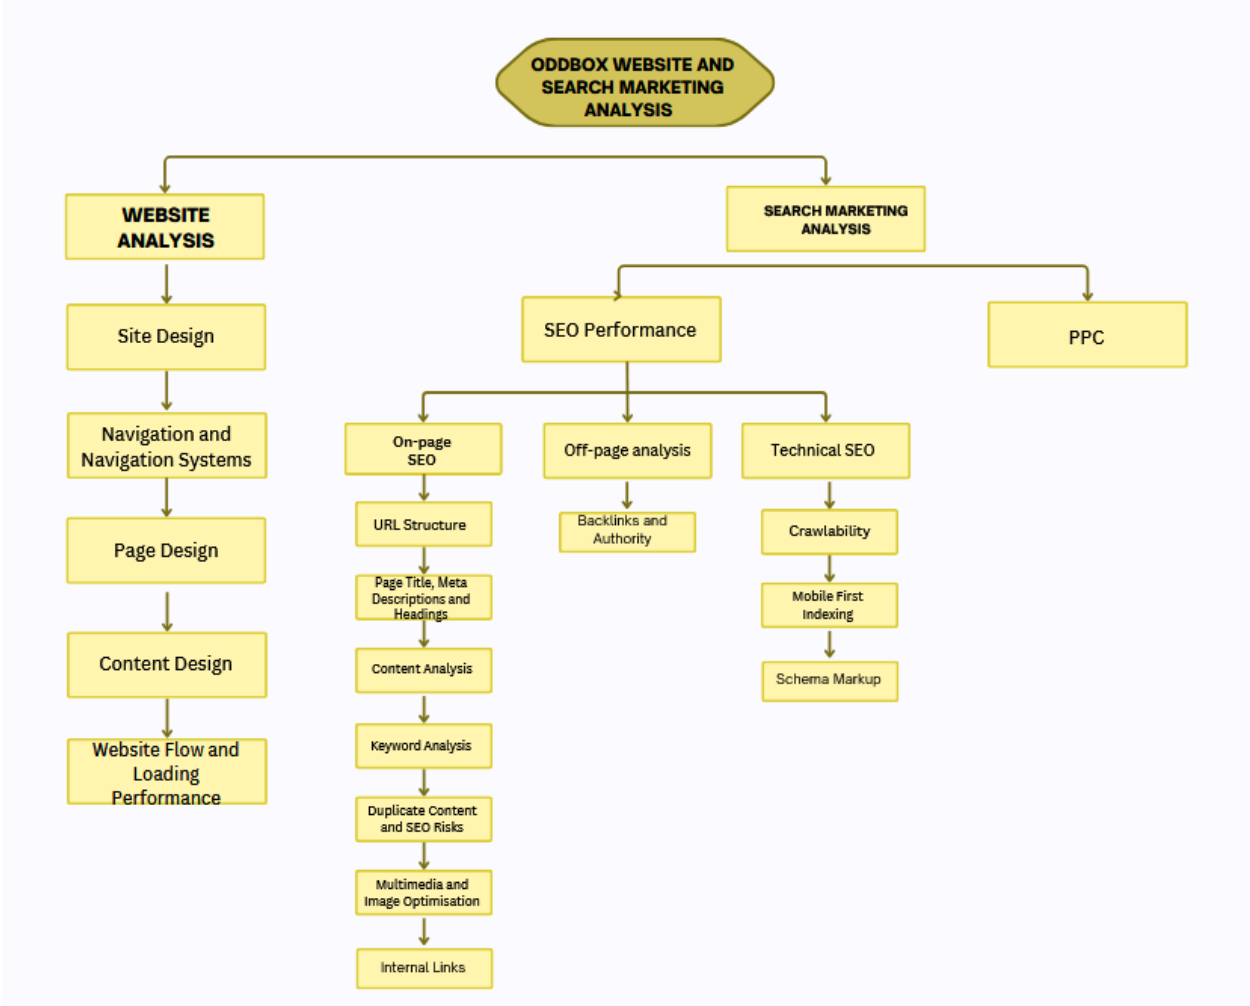

Figure10: Flow Chart of Analysis.

Recommendations:

Recommendation 1: Improve On-Page SEO (BOFU Focused)

Oddbox must strengthen on-page SEO by prioritising high-intent and commercial keywords through dedicated landing pages such as “veg box” “fruit box delivery” supported by clear CTAs (Gillin, 2024), strong internal linking and improved multimedia optimisation. Pages optimized for high-intent keywords can convert up to 2,400% better than top-of-funnel content aimed at

general awareness (Jane Cozens, Isla McKetta , 2025). This would capture users closer to purchase while improving engagement and technical performance.(Figure11)

Keyword	KD	Volume ↓	Updated
vegetable box delivery	Hard	>100	11 November
organic vegetable box delivery	Medium	>100	13 November
vegetable box delivery near me	Hard	>100	16 November
wholesale organic vegetable box delivery	N/A	<100	
farm vegetable box delivery	N/A	<100	
vegetable box delivery london	Hard	<100	13 November
fresh vegetable box delivery	N/A	<100	
seasonal vegetable box delivery	N/A	<100	
local vegetable box delivery	N/A	<100	
organic vegetable box delivery near me	N/A	<100	
wholesale organic vegetable box delivery near me	Sign up	<100	
best vegetable box delivery		<100	

Figure11: Keyword ideas (ahrefs, 2025).

Recommendation 2: Develop Off-Page Credibility and Authority

Oddbox should build website authority sustainably by focusing on quality backlinks from credible sources (Leigh McKenzie, 2025). This would help build up long term rankings while reinforcing Oddbox's ethical brand positioning.

Recommendation 3: Create SDG 2 and SDG 12 related Content

Oddbox should support SDG by introducing both SDG 12 (Responsible Consumption and Production) and SDG 2 (Zero hunger) through educational content that links food waste reduction to improve food availability, encourage responsible consumption and sustainable food systems (Yu, 2024). This implies Oddbox would contribute through awareness and advocacy rather than unrealistic claims of solving hunger directly.

Implementation Plans (As per SOSTAC):

Recommendation 1: Improve On-Page SEO (BOFU Focused)

The main objectives would be to:

- Increase organic traffic to BOFU pages by 20% in 4 months,
- Improve conversion rates on optimised pages by 10% and
- Increase overall dwell time by 15%.

This would be done through focus on few, high impact commercial pages rather than broad educational content, ensuring each page supports conversion.
We would do this by:

- Creating 4-5 high intent landing pages with clear pricing and CTAs.
- Optimise top 10 existing pages for image compression, alt tags and internal linking.
- Introduce geo-targeted URLs to capture local demand.
- Add short videos to improve engagement.

KPIs would include organic traffic, conversion rate and dwell time as well as bounce rates. These would be monitored using GA4 and GSC, tracking changes in organic sessions to BOFU pages, conversion rates from organic traffic and average session duration over the four month period.

Recommendation 2: Develop Off-Page Credibility and Authority

Objectives for off-page optimization would be to:

- Increase Domain Authority (DA) by 5 within 6 months,
- Gain 10 new referring domains and
- Increase referral traffic by 15%.

This would be done through sustainable storytelling and partnerships to earn natural backlinks aligned with sustainable eating and ethical consumption.
These can be achieved by:

- Publishing great guest posts on platforms that support the above
- Using HARO for expert recognition.
- Collaborating with micro influencers in sustainability and food communities, as they have great reach.
- Form one UK based local partnership with an environmental organisation.
- Maintaining natural anchor texts by reducing exact and partial phrase matches.

The KPIs for measuring these would be through DA, number of referring domains, referral traffic and brand mentions.
DA and referring domains will be measured using SEO tools such as Ahrefs or Moz, while referring traffic and brand mentions will be tracked through GA4 or Semrush/Ahrefs.

Recommendation 3: Create SDG 2 and SDG 12 related Content

Objectives for recommendation 3 would be to

- Increase engagement with SDG focused content by 25% within 6 months,

- Improve average time on SDG content pages by 20% and
- Earn 5 backlinks specifically from sustainability or NGO websites.

This would be done by positioning oddbox as a credible educator on the relevant SDG topics, aligning commercial goals with social responsibility.
These can be achieved by:

- Launching a monthly blog or short video series on food waste and redistribution
- Create infographic highlighting impacts of surplus food.
- Promoting content through email newsletter and social media.

KPIs for these would be Page traffic and engagement, Page dwell time, social shares and backlinks from sustainability related organisations. These metrics will be reviewed using GA4 for page traffic and dwell time, social media analytics for shares and Semrush/Moz to track backlinks from sustainability and NGO websites.

Cost for all three recommendations would be SEO/ website analytics softwares and inhouse or agency content team.

Overall performance will be reviewed monthly using GA4 and SEO tools to ensure each recommendation remains measurable, controlled and aligned with its stated objectives.
